Besides the common form of herpangina, encephalitic, pulmonary, and digestive forms liable to follow a severe course are identified. The great communicability of these infections and their untoward effects on the development of dystrophic or constitutionally small children, especially when the infection recurs frequently, are stressed. The importance of sustained symptomatic treatment is pointed out.

MOTORS. S.M. Popov.

ELECTRICAL ENGINEERING, VOL. 18, No. 8, 239-47 (Aug. 1946) [in Russian]

The basic problems of three-phase commutator motors are discussed and the author treats them as a general case of commutator and induction motors. The similarity between the basic treatment of commutator and induction motors is shown, and the circle diagram is discussed with particular reference to regulation. Commutating problems are discussed with different types of windings and a frequency converter or with commutators is described.

RUM/8-59-1-8/24AUTHORS: Bogdan, R.C., Pelecdi, Ch.TITLE: Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

PERIODICAL: Studii si Cercetări de Mecanică Aplicată, 1959, Nr 1, pp 141 - 149 (RUM)

ABSTRACT: The basic problem of the synthesis of mechanism consists in the determination of the geometrical parameters of a mechanism in such a way that a point or an element of it should match some laws of the given motion. The present tendency in the synthesis of mechanism is to satisfy the laws of motion in a maximum finite number of points or the approximation of the respective function with an error as small as possible on a certain effective working position. These problems can be solved analytically by the methods of the Soviet school represented by L.P. Chebyshev [Ref 4], L.V. Assur, I.I. Artobolevskiy [Ref 1], Z.S. Bloch [Ref 3], L.N. Levitskiy [Ref 7], S.A. Cherkudinov and others; or the German school, represented by L. Burmester, H. Alt, R. Beyer [Ref 2], R. Kraus [Ref 6], K. Hain [Ref 5], W. Lichtenfeldt, and others. The authors develop in this article the kinematic parameters of a four bar mechanism, in function of the crank rotation angle \varPhi , using the Fourier series in a complex form. They consider the harmonic analysis as being very important for the kinematic and dynamic

Card 1/7

80415
RUM/8-59-1-8/24

Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

characteristics of a mechanism, as did also W. Mayer zur Capellen [Ref 8]. They take into consideration the functions $\Phi = \Phi(\varphi)$, $\Psi = \Psi(\varphi)$, $Z = Z(\varphi)$ and $Z_o = Z_o(\varphi)$ and their derivations as representing the speeds and accelerations for the geometrical parameters of a four-sided mechanism

$$(Figure): e^{i\Phi}(\varphi) = \sum_{-\infty}^{+\infty} A_k e^{ik\varphi}, \quad (1)$$

$$e^{i\Psi}(\varphi) = \sum_{-\infty}^{+\infty} M_k e^{ik\varphi}, \quad (2)$$

$$Z_o(\varphi) = \sum_{-\infty}^{+\infty} N_k e^{ik\varphi}, \quad (3)$$

$$Z(\varphi) = \sum_{-\infty}^{+\infty} P_k e^{ik\varphi}, \quad (4).$$

The fix axes Oxy have their origin in the center of the basic element AD and the mobile axes O $\xi\eta$ are connected to the rod and have their

✓

Card 2/7

80415

RUM/8-59-1-8/24

Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

origin in the center of the BC rod. The polygonal contours OABO₁ and ODCO₁ have thus the vectorial relation:

$$\overline{OO}_1 = \overline{OA} + \overline{AB} + \overline{BO}_1 = \overline{OD} + \overline{DC} + \overline{CO}_1 \text{ and } \overline{OM} = \overline{OO}_1 + \overline{O}_1M.$$

Using the complex representation of the vectors:

$$Z_0 = \frac{1}{2} + re^{i\varphi} + \frac{L}{2} e^{i\psi} = \frac{1}{2} + Re^{i\phi} - \frac{L}{2} e^{i\psi} \quad (5)$$

and $Z = Z_0 + \beta e^{i\psi}$ (Nr 6), the authors deduce the relation for the identification of the coefficients:

$$\sum_{-\infty}^{+\infty} (B_k e^{ik\psi} + \bar{B}_k e^{-ik\psi}) = 2\alpha_1 e^{i\psi} + 2\alpha_{-1} e^{-i\psi} + 2\alpha_0 \quad (13)$$

$$\sum_{-\infty}^{+\infty} (B_k + \bar{B}_{-k}) e^{ik\psi} = 2\alpha_1 e^{i\psi} + 2\alpha_{-1} e^{-i\psi} + 2\alpha_0$$

and thus:

✓

80/15
RUM/8-59-1-8/24

Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

$$B_0 + \bar{B}_0 = 2\alpha_0, \quad (14)$$

$$B_1 + \bar{B}_{-1} = 2\alpha_1,$$

.....

$$B_k + \bar{B}_{-k} = 2\alpha_k.$$

The constants B_k are the complex coefficients of the Fourier series for the function:

$$f(\varphi) = e^{i\phi} (\ell - re^{-i\varphi}) = \sum_{-\infty}^{+\infty} B_k e^{ik\varphi} \quad (15)$$

and its conjugate relation. The conditions (14) are being imposed by the geometry of the four-sided mechanism, by which the function ϕ depends from φ . Another series of relations between the coefficients A_k , respectively B_k can be obtained by taking the products of the relations (10) and (15), thus:

$$\sum_{-\infty}^{+\infty} A_k \bar{A}_k = 1 \quad \sum_{-\infty}^{+\infty} A_k \bar{A}_{k+m} = 0, \text{ for } m \neq 0. \quad (17)$$

V

Card 4/7

80415
RUM/8-59-1-8/24

Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

$$\sum_{-\infty}^{+\infty} B_k \bar{B}_{k+m} = \beta_0 - 1^2 + r^2, \quad \beta_m = 0, \quad \beta_1 = \beta_{-1} = -lr, \quad m \neq -1, 0, +1. \quad (18).$$

Performing the transformation: $C_k = B_k - \alpha_k$ (Nr 19), the C_k constants are the complex coefficients of the Fourier series for the function:

$$F(\varphi) = f(\varphi) - \alpha_{-1} e^{-i\varphi} - \alpha_1 e^{i\varphi} - \alpha_0 = \sum_{-\infty}^{+\infty} C_k e^{ik\varphi} \quad (20)$$

and its conjugate. From the definition of the $F(\varphi)$ function results that:

$$F(\varphi) = -\bar{F}(\varphi) = \frac{f(\varphi) - \bar{f}(\varphi)}{2} \quad (22),$$

$$\text{which attracts } C_k + \bar{C}_{-k} = 0, \quad C_k = \frac{B_k - \bar{B}_{-k}}{2} \quad (23)$$

$C_k + \bar{C}_{-k} = 0$, $C_k = \frac{B_k - \bar{B}_{-k}}{2}$ the function $F(\varphi)$ being purely imaginary. The relation corresponding to the points (17) and (18) leads after a deduction to:

$$\sum_{-\infty}^{+\infty} C_k \bar{C}_{-k+m} = -T_m, \quad (25) \quad \checkmark$$

Card 5/7

80415

RUM/8-59-1-8/24

Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

which shows that if C_k are the complex coefficients of the Fourier series for the function $F(\varphi)$, then γ_m are the complex coefficients of the Fourier series for the function $F^2(\varphi)$:

$$F^2(\varphi) = - \sum_{m=-2}^{+2} \gamma_m e^{im\varphi} = - (\gamma_0 + 2\gamma_1 \cos \varphi + 2\gamma_2 \cos 2\varphi) \quad (26).$$

For the determination of the constants C_k and then of B_k and finally of A_k , it would be necessary to solve the infinite system of the nonlinear equation (25) or to develop in a Fourier series the imaginary pair function:

$$F(\varphi) = F(-\varphi) = i\sqrt{\gamma_0 + 2\gamma_1 \cos \varphi + 2\gamma_2 \cos 2\varphi}, \quad (27)$$

$$\text{which attracts: } C_k = C_{-k}, \quad C_k + \bar{C}_k = 0, \quad (28).$$

The authors develop the $F(\varphi)$ function in a Fourier series, finally obtaining:

$$F(\varphi) = \sum_{n=0}^{\infty} \frac{F^{(n)}(0)}{n!} \left[\sum_{k=0}^n C_n^k e^{i(n-2k)\varphi} \right].$$

4

Card 6/7

80415

RUM/8-59-1-8/24

Synthesis of a Four Bar Mechanism on the Basis of Harmonic Analysis

Taking this formula for $n - 2k = m$ constant, the coefficient of the Fourier series is being obtained:

$$c_m = \sum_{n=0}^{\infty} \frac{F^{(n)}(0)}{n!} C \frac{n-m}{2}, \quad (36)$$

Since the variation law of the parameter ϕ , Ψ , Z_0 , Z , function of φ is given, the respective Fourier series has to be determined and compared with the parameter possibly reproduced by the four-sided mechanism, either satisfying in a maximum finite number of points or approximating an effective working portion with a minimum of error.

There are: 1 figure and 9 references, 5 of which are German and 4 Russian.

A. P. Kozlov, Engineer; Tech. Ed.: B. I. Model'.

PURPOSE: This collection of articles is intended for engineers, designers, workers at scientific research institutes, and instructors at schools of higher technical education.

COVERAGE: This collection consists of reports presented at the All-Union Conference on Problems in the Theory of Machines and Mechanisms held in Moscow in 1958. The reports discuss several problems of the dynamic design of complex mechanical systems. No personalities are mentioned. References accompany most of the articles.

AUTHORS: Pelecudi, Chr., Bogdan, R. C., and Calmaciuc, L.

TITLE: On the bending stresses and deformations of caps in crank-mechanisms

PERIODICAL: Studii si cercetări de mecanică aplicată, no. 5,
1961, 1047-1056

TEXT: The article deals with the stresses and deformations, to which piston rod caps are subjected. To determine the forces appearing in the caps of simple crank-mechanisms, the authors establish the following hypotheses. (a) The assembly axis of the cap to the rod is perpendicular to the axis of the rod. (b) The mass of the rod decomposed into two masses concentrated at the large end and small end of the rod is considered to be a simplifying factor. (c) V and H are the forces due to the crank pin, supplying the resultant P which acts on the cap. (d) $F(\theta)$ is the force due to the gass pressure exerted on the piston surface. (e) N and μN are the perpendicular and the tangential reactions between the cylinder

Card 1/9

R/008/61/000/005/002/005
D289/D305

On the bending stresses ...

and the piston. (f) F_A and F_B are the inertia forces of the rod - piston system, considering the simplifying hypothesis of the distribution of the rod mass to the two points A and B. Starting with the expressions of H and V deduced from the force equilibrium (Fig. 1):

$$H = - F_B \sin (\theta + \delta) \quad (1)$$

$$V = F_B \cos (\theta + \delta) - \frac{(F + F_A) \cos \varphi}{\cos (\delta - \varphi)} \quad (2)$$

in which $\varphi = \operatorname{arctg} \mu$ is the friction angle, positive for θ between 0 and 180° and negative for θ between 180° and 360° , the authors deduce, after having established the expressions of the inertia forces F_B and F_A :

$$F_B = m_B r \omega^2 \quad (5)$$

Card 2 / 9

On the bending stresses ...

R/008/61/000/005/002/005
D289/D305

and

$$F_A = m_A \ddot{x}_A = - m_A r \omega^2 \left[\frac{\cos(\theta + \delta)}{\cos \delta} + \lambda \frac{\cos^2 \theta}{\cos^3 \delta} \right] \quad (6)$$

the relations

$$H = - m_B r \omega^2 \sin \theta \quad (9)$$

and

$$V = (m_A + m_B) r \omega^2 \cos \theta \quad (10)$$

which supply the approx. shape of the variation of the H and V forces, based on the boundary case $\lambda = 0$ and $\delta = 0$. H describes a sine line and V a cosine line. θ approx varies between $-\pi/2$ and $+\pi/2$. The angle α under which the P(H and V) force stresses the

Card 3/9

On the bending stresses ...

R/008/61/000/005/002/005
D289/D305

cap, varies approx. linearly with the time:

$$\operatorname{tg}\alpha = \frac{V}{H} \approx - \left(1 + \frac{m_B}{m_A} \right) \operatorname{ctg}\theta, \quad \alpha \approx \pi t^2 + \theta \quad (11)$$

To establish the forces which stress the cap of the master and articulated rods of a V-engine (Fig. 3), the authors deduce for H:

$$H = - M_H r \omega^2 \sin \theta - m_A r \omega^2 \lambda \sin 2\theta \sin \frac{\gamma}{2} + \\ + [F_2(\theta_2) - F_1(\theta_1)] \sin \frac{\gamma}{2} \quad (25)$$

Card 4/9

On the bending stresses ...

R/008/61/000/005/002/005
D289/D505

in which M_H is given by:

$$M_H = 2 \left(m_B + m_A \sin^2 \frac{\zeta}{2} \right)$$

and for V:

$$V = M_V r \omega^2 \cos \theta + 2m_A r \omega^2 \lambda \left[\cos^2 \theta \cos^2 \frac{\zeta}{2} + \sin^2 \theta \sin^2 \frac{\zeta}{2} \right] \cos \frac{\zeta}{2} - \\ - [F_1(\theta_1) + F_2(\theta_2)] \cos \frac{\zeta}{2}$$

in which M_V is given by:

$$M_V = 2 \left(m_B + m_A \cos^2 \frac{\zeta}{2} \right) \quad (26)$$

Card 5/9

On the bending stresses ...

R/008/61/000/005/002/005
D289/D305

To determine the deformations of the rod cap, the authors take into consideration the resultant P of the forces H and V, the reacting force of the screws F, and the supporting forces H_1 and H_2 between the rod and cap accomplished by a wedge, bolts, or friction, as shown in Fig. 5. The bending moments on the (1 - P) and (P - 2) sections are given by:

$$M_1 = (H_1 \sin \Psi + F \cos \Psi)r - F(e + r) \quad (29)$$

and

$$M_2 = (H_2 \sin \Psi - F \cos \Psi)r - F(e + r) \quad (30)$$

and, according to Castigliano's theorem, the non-impeded displacement of the support No. 1 in case of a constant bending rigidity is given by:

Card 6/ 9

R/008/61/000/005/002/005
D289/D305

On the bending stresses ...

$$u_1 = \frac{r^3}{2EI} \left[\pi H_2 - H \left(\alpha + \operatorname{tg}^{-1} \left(1 + \frac{2e}{r} \right) \right) \right] \text{ and } u_2 = 0 \quad (32)$$

The authors finally establish the deformation and force diagrams of the separation plane. According to the type of action of forces and deformations, they distinguish the following cases. (a) Lateral displacement impeded by wedges in a single direction. (b) The displacement of both supports is impeded in every moment. (c) The displacement of the no. 2 support is impeded and the no. 1 support supplies an elastic reaction. (d) The no. 1 support supplies an elastic reaction followed by a constant force, due to possible friction. In accordance with these situations, various forces are produced in the assembly screws, depending on whether the screws react to the stresses produced by the cap by elastic bending, shearing, etc. These stresses may be avoided or reduced by using corresponding wedges, bushings, or bolts with close tolerances.

SOURCE: Revista sanitara militara, no. 6, 1964, 993-1001

TOPIC TAGS: surgery, digestive system disease, internal medicine, digestive system

ABSTRACT: The authors have reached the following conclusions:
the only treatment for chronic lithic cholecystitis is cholecystectomy. In regular cases the surgery and postoperative period proceed smoothly; when septic, mechanical and other complications are present the surgery and postoperative period are more difficult. 3. Acute cholecystitis cases, promptly operated had a much better and rapid recovery than those delayed. 4. Antibiotics are not an actual treatment but only an aid in preparing for operation and in postoperative care. 13 references, mainly Rumanian.

BORDAN, E. V.

Chemical Abst.
Vol. 48 No. 4
Feb. 25, 1954
Soils and Fertilizers

Experimental use of phosphorus³³ isotope for characterization of methods of extraction of mobile forms of soil phosphates. E. V. Bordan. Izvest. Akad. Nauk S.S.R., Ser. Biol. 1953, No. 6, 60-71. It is pointed out that in the prepn. of aq. exts. of soil specimens the processes of soln. and pptn. of phosphates must be considered. By means of P³³-labeled phosphate the lability or mobility of phosphate in various soil specimens was examined, the methods of Truog (dil. H₂SO₄ at pH 3), of Kirsanov (0.2N HCl), of Egner (lactate method of extn.), and the NH₄F method (0.1N soln.) being used. It was shown that 0.2N HCl does not ext. all the phosphate added to a soil, leaving behind 32-65% of "absorbed form." Low-saline chernozem and mid-podzols absorb 62-8% of added phosphate. Sandy podzol soil in subplowing horizons absorbs the least aunts. of phosphate. The results are explained by the variation of content of R₂O₃ metallic oxides. The Truog method is more efficient than the Kirsanov method for extg. phosphate. The NH₄F method exts. generally less than 50% of the added phosphate. The lactate method exts. 77-100% of added phosphate only from sandy podzols; from other soils the efficiency is only 35-65%.
